# [Solved] Items could not be retrieved, Internal server error - Heroku and Github

Github   *Faysal Shuvo*

Problem:

I have created a website. Now I want to upload it to Heroku. Also, Heroku should fetch my website from Github. But when I was trying to do it, I got this error:

```
Items could not be retrieved, Internal server error.
```

So in this article, we are going to learn how to fix "Items could not be retrieved, Internal server error - Heroku and Github" this problem.

Solution:

You could upload your website in Heroku using Github. But there is a security issue regarding this method. You can read in detail about it here. So until they solve this issue you have to use **Heroku CLI** to upload your website. To do this follow these steps:

```
heroku create -a app-name
```

To check that a remote named Heroku has been set for your app do this:

```
git remote -v
```

And if you already have a repository on Github, you need to run a new remote by running:

```
heroku git:remote -a app-name
```

Now to deploy your code to Heroku, use the git push command with Heroku:

```
git push heroku main
```

Whenever you want to deploy the latest committed version of your code to Heroku use this command. This command will only affect the code you push to the master or main branches. Heroku remote has no effect on other branches.

Hope this will solve your problem. If you have any more questions you can comment below.

Still now problem not solved?
